Ground Penetrating Radar Systems Minimizes Dangers Beneath the Surface

What We Can Do For You:

CONCRETE SCANNING

- Layout of Rebar and Post Tensioning prior to core drilling and saw cutting
- Layout of Embedded Electrical Conduit prior to core drilling and saw cutting
- Detection of Voids below floor slabs
- Concrete Deterioration Mapping

GROUND BASED SCANNING

- Underground Storage Tank (UST's) investigations
- Layout / Detection of Underground Utilities
- Burial / Cemetery Investigations
- Subsurface Void Detection

The mission of GPRS is to provide solutions to the critical problems our customers face regarding the location of hidden elements in concrete and underground. We have a group of highly skilled technicians who are dedicated to providing the highest level of service possible to GPRS customers.

Concrete should always be scanned prior to core drilling or saw cutting. The dangers of electrocution or cutting through a post-tension cable are minimized when GPRS scans any concrete that is going to be cut. Using GPR prior to making slab penetrations is the safe and responsible thing to do.
